```
5 if (isset($_POST['uname']) and isset($_POST['pwd'])){  
6     $sql = "Select title, name, uname from users where uname = '" . $_POST['uname'] . "' and password = '" . $_POST['pwd'] . "'";  
7     $result = $mysqli->query($sql);  
8  
9     if(!$mysqli->error){  
10        $user = $result->fetch_object();  
11  
12        if ($user !== NULL){  
13            $_SESSION['uname'] = $user->uname;
```

Select title, name, uname from users where uname = 'test' and password = 'password';

Username or password is wrong.

The screenshot shows a web browser window with the URL `lightside.me/shop/login.php`. The page title is "Hey fellow jedi, welcome to our lightsaber shop!". It contains a form with fields for "Username" (containing "test") and "Password" (containing masked input). A "Login" button is present.

Hey fellow jedi, welcome to our lightsaber shop!

Username:

Password:

```
5 < if (isset($_POST['uname']) and isset($_POST['pwd'])){  
6     $sql = "Select title, name, uname from users where uname = '" . $_POST['uname'] . "' and password = '" . $_POST['pwd'] . "'";  
7     $result = $mysqli->query($sql);  
8  
9     if(!$mysqli->error){  
10        $user = $result->fetch_object();  
11  
12        if ($user !== NULL){  
13            $_SESSION['uname'] = $user->uname;
```

Select title, name, uname from users where uname = 'test' and password = 'password';

You have an error in your SQL syntax; check the manual that corresponds to your MariaDB server version for the right syntax to use near 'password" at line 1

The screenshot shows a web browser window with the URL `lightside.me/shop/login.php`. The page title is "Hey fellow jedi, welcome to our lightsaber shop!". There are two input fields: "Username: test' or 1=1; --" and "Password: [REDACTED]". A "Login" button is below the fields.

```
Username: test' or 1=1; --
Password: [REDACTED]
Login
```

```
5 if (isset($_POST['uname']) and isset($_POST['pwd'])){  
6     $sql = "Select title, name, uname from users where uname = '" . $_POST['uname'] . "' and password = '" . $_POST['pwd'] . "'";  
7     $result = $mysqli->query($sql);  
8  
9     if(!$mysqli->error){  
10        $user = $result->fetch_object();  
11  
12        if ($user !== NULL){  
13            $_SESSION['uname'] = $user->uname;
```

Select title, name, uname from users where uname = 'test' or 1=1; -- ' and password = 'password';

A small white box contains the text "User: mastery" and a "Logout" button.

```
User: mastery Logout
```

That's pretty nice,
but how can we retrieve
data?

Information Schema COLUMNS Table

The `Information Schema COLUMNS` table provides information about columns in each table on the server.

It contains the following columns:

Column	Description	Introduced
<code>TABLE_CATALOG</code>	Always contains the string 'def'.	
<code>TABLE_SCHEMA</code>	Database name.	
<code>TABLE_NAME</code>	Table name.	
<code>COLUMN_NAME</code>	Column name.

SQL Injection

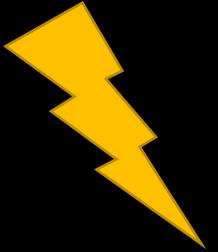

Goal	Retrieve/manipulate data in database or manipulate logical flow
How	
Solution	
OWASP Top 10	
(Primary) Violated Principle	

SQL Injection

Goal	Retrieve/manipulate data in database or manipulate logical flow
How	By manipulating the structure of the sql query through userdata Different types - Verbose / Blind (Time based) SQLi
Solution	
OWASP Top 10	
(Primary) Violated Principle	

SQL Injection

Goal	Retrieve/manipulate data in database or manipulate logical flow
How	By manipulating the structure of the sql query through userdata Different types - Verbose / Blind (Time based) SQLi
Solution	Input Validation (and WAFs) Prepared Statements Abstraction (e.g. ORMs)
OWASP Top 10	
(Primary) Violated Principle	

Prepared Statements example

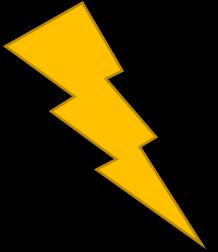

```
5 ✓ if (isset($_POST['uname']) and isset($_POST['pwd'])){  
6     $sql = "Select title, name, uname from users where uname = '" . $_POST['uname'] . "' and password = '" . $_POST['pwd'] . "'";  
7     $result = $mysqli->query($sql);  
8  
9    if (!$mysqli->error){  
10        $user = $result->fetch_object();  
11  
12    if ($user !== NULL){  
13        $_SESSION['uname'] = $user->uname;
```

```
5    if (isset($_POST['uname']) and isset($_POST['pwd'])){  
6        $sql = "Select title, name, uname, password from users where uname = ?;";  
7        $statement = $mysqli->prepare($sql);  
8        $statement->bind_param('s', $_POST['uname']);  
9        $statement->execute();  
10       $result = $statement->get_result();  
11  
12       if (!$mysqli->error){  
13           $user = $result->fetch_object();  
14  
15           if ($user !== NULL && $user->password == $_POST['pwd'])){  
16               $_SESSION['uname'] = $user->uname;
```

ORM example (Doctrine)

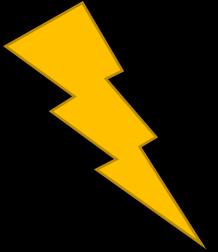

```
1 <?php
2 // src/Product.php
3
4 use Doctrine\ORM\Mapping as ORM;
5
6 /**
7 * @ORM\Entity
8 * @ORM\Table(name="products")
9 */
10 class Product
11 {
12     /**
13     * @ORM\Id
14     * @ORM\Column(type="integer")
15     * @ORM\GeneratedValue
16     */
17     protected $id;
18
19     /**
20     * @ORM\Column(type="string")
21     */
22     protected $name;
23
24     // .. (other code)
25 }
```

```
1 <?php
2 // update_product.php <id> <new-name>
3 require_once "bootstrap.php";
4
5 $id = $argv[1];
6 $newName = $argv[2];
7
8 $product = $entityManager->find('Product', $id);
9
10 if ($product === null) {
11     echo "Product $id does not exist.\n";
12     exit(1);
13 }
14
15 $product->setName($newName);
16
17 $entityManager->flush();
18
19 echo sprintf("-%s\n", $product->getName());
20 }
```

SQL Injection

Goal	Retrieve/manipulate data in database or manipulate logical flow
How	By manipulating the structure of the sql query through userdata Different types - Verbose / Blind (Time based) SQLi
Solution	Input Validation (and WAFs) Prepared Statements Abstraction (e.g. ORMs)
OWASP Top 10	A03:2021-Injection
(Primary) Violated Principle	

SQL Injection

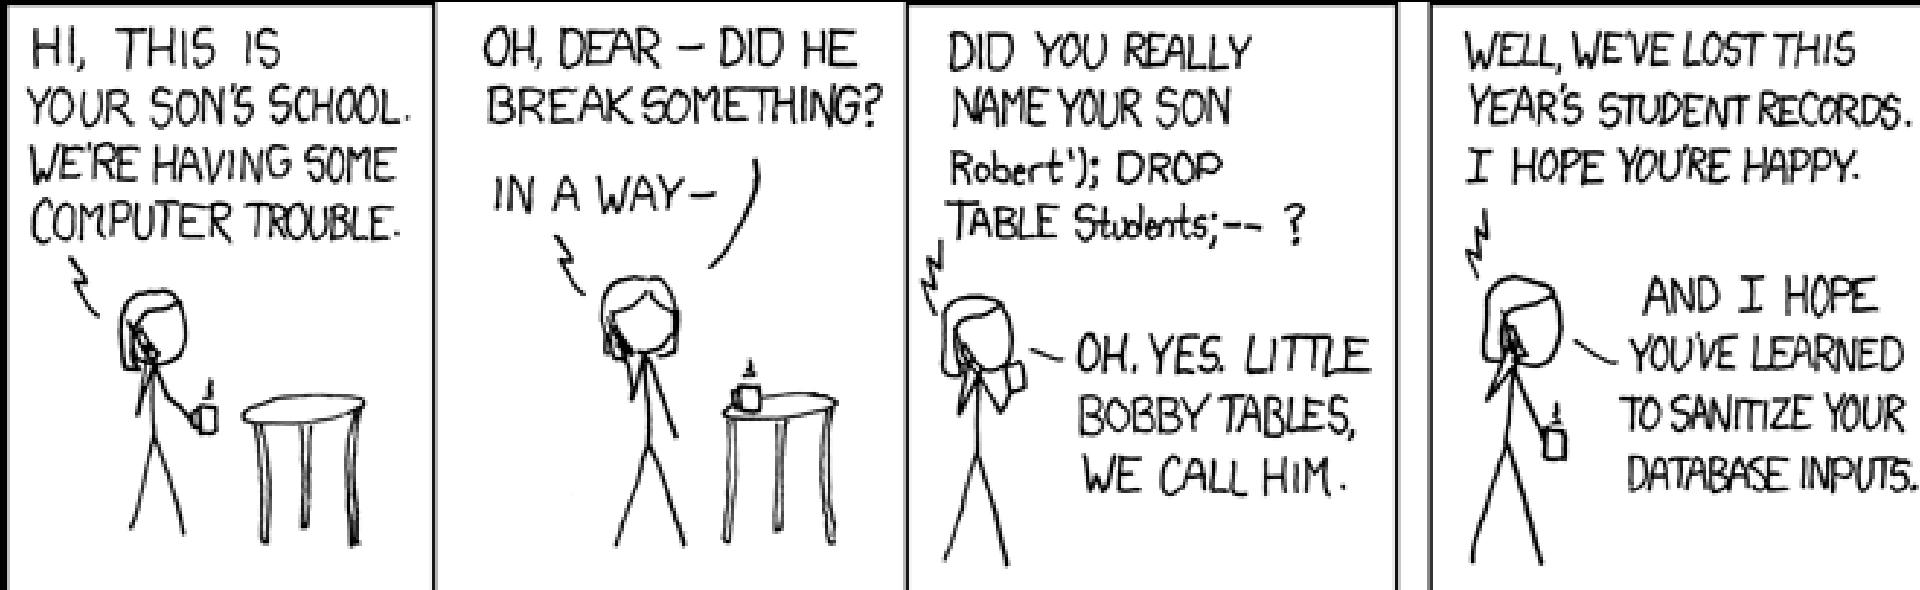

Goal	Retrieve/manipulate data in database or manipulate logical flow
How	By manipulating the structure of the sql query through userdata Different types - Verbose / Blind (Time based) SQLi
Solution	Input Validation (and WAFs) Prepared Statements Abstraction (e.g. ORMs)
OWASP Top 10	A03:2021-Injection
(Primary) Violated Principle	„Strictly separate data and control instructions, and never process control instructions received from untrusted sources.“

Further exploitation

what else you can do heavily depends on

- the query you're injecting into
 - SELECT, INSERT INTO, UPDATE, DELETE, EXEC
- the operating system and dbms configuration
 - reading / writing files
 - e.g. MySQL: load_file
 - executing OS commands
 - e.g. MS SQL: xp_cmdshell, xp_servicecontrol

Old but gold

<https://xkcd.com/327/>

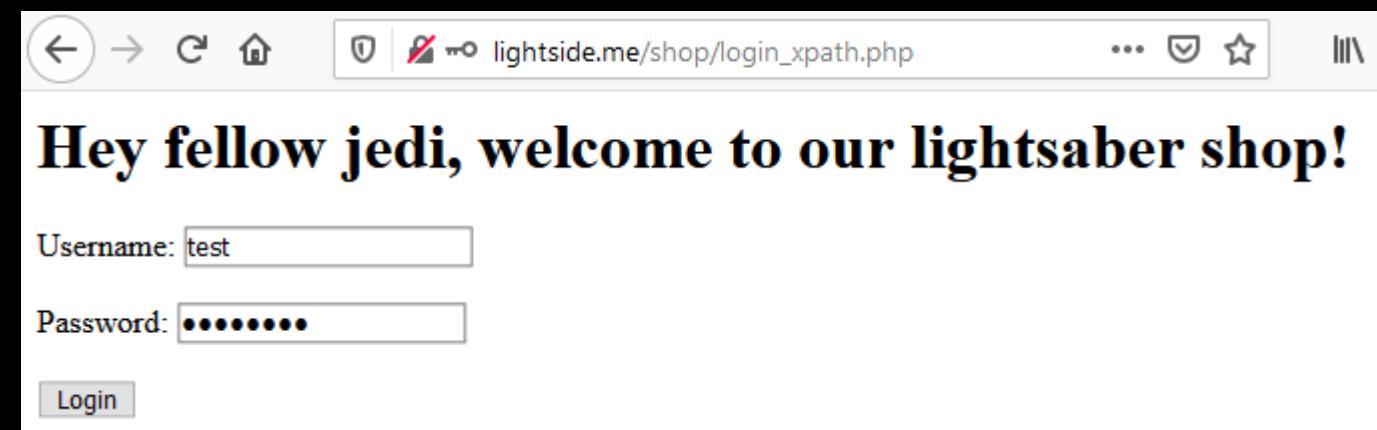

<https://9gag.com/gag/aBg8PLx>

main problem:

user input
included in sql (backend) context
messes up the predefined query structure

can you think of any other backend
context we can mess with?
(xxx injection)

```
1 <?xml version="1.0" encoding="utf-8"?>
2 <users>
3   <user>
4     <title>master</title>
5     <name>yoda</name>
6     <uname>mastery</uname>
7     <password>forgottenmypasswordIhave</password>
8   </user>
9   <user>
10    <name>luke skywalker</name>
11    <uname>luke</uname>
12    <password>whoismyfather?</password>
13  </user>
14  <user>
15    <name>han solo</name>
16    <uname>captain_han</uname>
17    <password>lovelea</password>
18  </user>
19 </users>
```

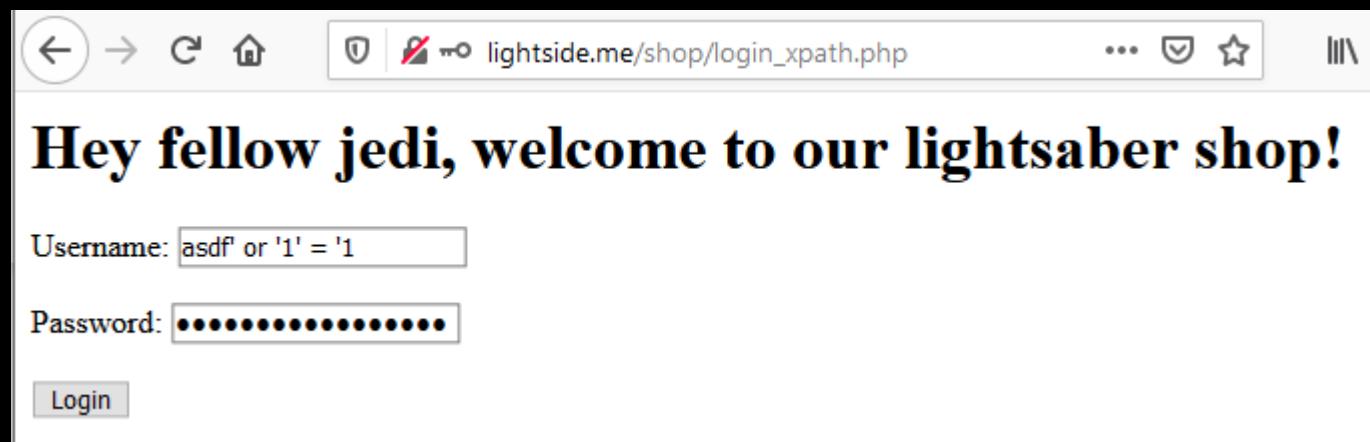

```
5 <?php
6 if (isset($_POST['uname']) and isset($_POST['pwd'])){
7   $xml = simplexml_load_file('users.xml');
8
9   if ($xml !== FALSE){
10     $result = $xml->xpath("//user[uname='".$POST['uname']."' ][password='".$POST['pwd']."' ]");
11
12     if ($result != NULL)
13     {
14       $user = $result[0];
15       $_SESSION['uname'] = (string)$user->uname;
```

//user[uname='test'][password='password']

Username or password is wrong.

```
1  <?xml version="1.0" encoding="utf-8"?>
2  <users>
3    <user>
4      <title>master</title>
5      <name>yoda</name>

Characters for separation

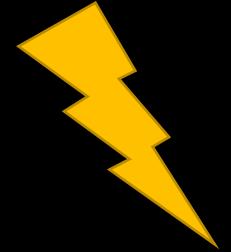

Windows and Linux/Unix:

- & && | ||

Linux/Unix only:

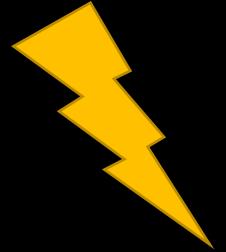

- ; \n
- execution within original command:
 - `cmd`
 - \$(cmd)

OS Command Injection

Goal	Execute malicious commands on server
How	
Solution	
OWASP Top 10	
(Primary) Violated Principle	

OS Command Injection

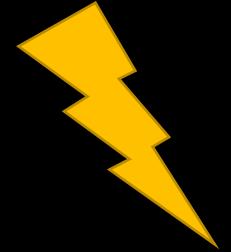

Goal	Execute malicious commands on server
How	By manipulating the structure of the OS command through userdata
Solution	
OWASP Top 10	
(Primary) Violated Principle	

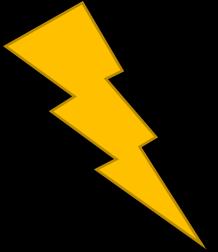

Countermeasures

- Just don't directly call OS-commands with user input from application code!
 - Use safer language/platform specific APIs
- If you have to use them
 - Just don't
- If you really have to use them
 - STRICT Input Validation
 - Explicit Allowlist, Typecasting etc.
 - Separation of command and input
 - e.g. subprocess.run() in python
 - Parameter escaping
 - e.g. escapeshellcmd() in php

OS Command Injection

Goal	Execute malicious commands on server
How	By manipulating the structure of the OS command through userdata
Solution	Avoid using direct OS commands Usage of safer APIs for the specific purpose Strict input validation Separation of command and parameters Escaping of parameters (output encoding)
OWASP Top 10	
(Primary) Violated Principle	

OS Command Injection

Goal	Execute malicious commands on server
How	By manipulating the structure of the OS command through userdata
Solution	Avoid using direct OS commands Usage of safer APIs for the specific purpose Strict input validation Separation of command and parameters Escaping of parameters (output encoding)
OWASP Top 10	A03:2021-Injection
(Primary) Violated Principle	„Strictly separate data and control instructions, and never process control instructions received from untrusted sources.“

Quiz Time

can you think of another
common way to inject
code on a server?

A screenshot of a web browser window. The address bar shows the URL "lightside.me/upload.php". The main content area displays a profile picture of Obi-Wan Kenobi from Star Wars, wearing his brown robe and holding a lightsaber. Above the image, the text "Welcome Master Kenobi" is displayed. Below the image, the text "Nice profile pic you have here." is shown. At the bottom, there is a form with the text "Still wanna upload a new one?", a "Browse..." button, the message "No file selected.", and an "Upload" button.

```
25 |         <form method="post" enctype="multipart/form-data">
26 |             <input type="hidden" name="MAX_FILE_SIZE" value="10000000">
27 |             <input name="pic" type="file" accept="image/jpeg,image/png">
28 |             <input type="submit" value="Upload"/>
29 |         </form>
30 |
31 |     10  if (!empty($_FILES)){
32 |     11      move_uploaded_file($_FILES['pic']['tmp_name'], $uploadfolder.$_FILES['pic']['name']);
33 |     12      $_SESSION['profilepic'] = $_FILES['pic']['name'];
34 |     13  }
```

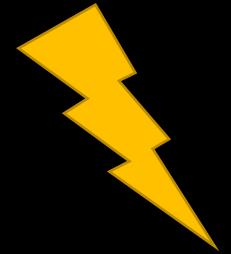

do you see any problems?

```
1 POST /upload.php HTTP/1.1

Insecure File Upload

Goal

Upload a malicious file for execution of code

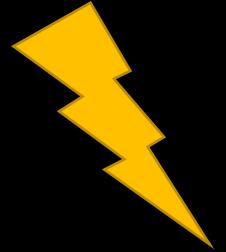

How

Solution

OWASP Top 10

(Primary)
Violated Principle

Insecure File Upload

Goal	Upload a malicious file for execution of code
How	By exploiting insufficient server-side restrictions
Solution	
OWASP Top 10	
(Primary) Violated Principle	

Countermeasures (excerpt)

- If possible, just store them in a database (or a S3 bucket etc.)
- Don't use the original file name -> create a new one
- Store the file outside of the webroot
 - recommended: on a separate partition or even a separate file server
- Check the real filetype
 - e.g. in php: `mime_content_type()`
- Set max filesize
 - e.g. in php: `post_max_size` and `upload_max_filesize`
- More recommendations
 - https://owasp.org/www-community/vulnerabilities/Unrestricted_File_Upload

Remember request routing ???

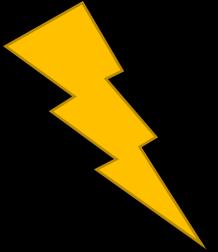

Classic routing: <http://example.com/showprofile.php>

it's php
file showprofile.php gets
executed with php interpreter

Explicit routing: <http://example.com/showprofile>

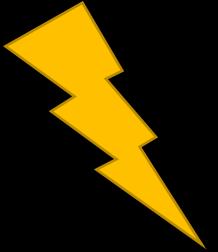

e.g. Laravel (PHP): `Route::get('/showprofile', [UserController::class, 'showprofile']);`
<https://laravel.com/docs/8.x/routing>

e.g: Django (Python): `urlpatterns = [path('/showprofile', views.userprofile)]`
<https://docs.djangoproject.com/en/3.1/topics/http/urls/>

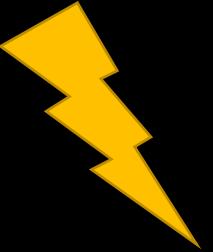

Insecure File Upload

Goal	Upload a malicious file for execution of code
How	By exploiting insufficient server-side restrictions
Solution	<ul style="list-style-type: none">Don't trust any metadata sent from the clientCreate a new nameStore it outside the webrootCheck the real mimetypeSet max filesize

use library to normalize an IP

e.g. InetAddress in Java

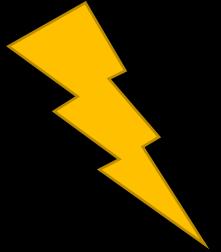

```
InetAddress myAddress = InetAddress.getByName(url.getHost());  
if (myAddress.isLoopbackAddress()){  
    // 127.0.0.1  
}
```

Server-Side Request Forgery (SSRF)

Goal	Force the server to send requests to internal or external systems / services or even the server itself (localhost)
How	By manipulating URLs for backend requests
Solution	Segment and strictly filter your network (allow-list; internet access needed?) Strict input validation (allow-list; schema, path, port,...) Don't relay the raw backend response to the client
OWASP Top 10	
(Primary) Violated Principle	

Server-Side Request Forgery (SSRF)

Goal

Force the server to send requests to internal or external systems / services or even the server itself (localhost)

How

By manipulating URLs for backend requests

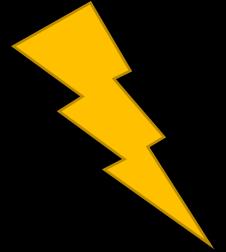

Solution

Segment and strictly filter your network (allow-list; internet access needed?)
Strict input validation (allow-list; schema, path, port,...)
Don't relay the raw backend response to the client
Enforce authentication for internal (backend) services also

OWASP Top 10

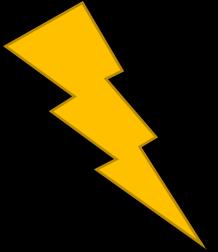

(Primary)
Violated Principle

OWASP Top 10	A10:2021 – Server-Side Request Forgery (SSRF)
(Primary) Violated Principle	Earn or give, but never assume, trust. (Define an approach that ensures all data are explicitly validated.)

Quiz Time

Key messages

- Most interactions with backend systems can be attacked with similar kinds of injections
- Strictly separate code structure and user input
 - always be aware of the context user input is used in
- Strictly validate user input
- Never trust anything from the client – ever...

**THE CLIENT,
YOU MUST NEVER TRUST**
